Table 1: Positive-class F_1 scores for neutral (*Neutral*) and trait-conditioned (*Cond.*) predictions, both evaluated against the same matching trait-specific proxy labels on the same examples. Boldface marks the higher score within each pair; ties at the displayed precision are bolded in both columns. An asterisk (*) marks the higher unrounded score when the paired difference is significant after Holm correction ($p_{\text{Holm}} < 0.05$). Significance is assessed using a two-sided paired approximate randomization test with 10,000 randomizations, swapping whole original-post (MP) or original-context (CSC) clusters. Holm families comprise all comparisons within each dataset–model pair (six for MP; eight for CSC, including traits and relationships).

Model	**Trait**	CANTRIP$_{\text{MP}}$		CANTRIP$_{\text{CSC}}$	
		Neutral	Cond.	Neutral	Cond.
